## FOREWORD.

---

It gives me great pleasure to preface this Bulletin with a few remarks relative to the future policy of the Department of Mines, concerning publications dealing with the mineral deposits of the State of Western Australia.

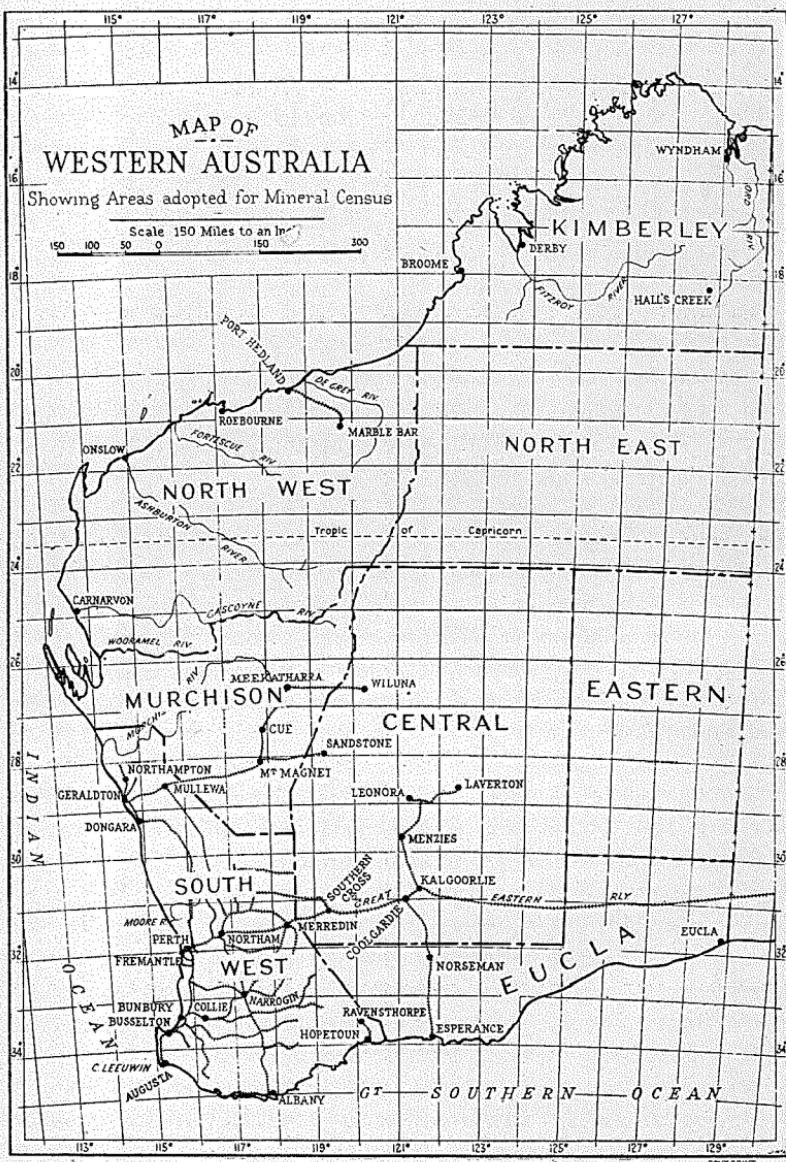

In the past, such publications, with the exception of the Department's Annual Report, have usually dealt with reports emanating from one Branch such as the Geological Survey Bulletins, the State Mining Engineer's Reports and other similar ones.

While these will still continue to issue where the subjects are such as are particularly applicable to one Branch, it is intended to also produce general Departmental bulletins dealing with subjects on which useful information can be contributed by several branches. These should be of special value to the public as being of a comprehensive nature, and will mainly concern minerals of present and future industrial value to our country.

In addition to providing geological information of known deposits, they will also contain mineralogical details, methods of mining and anything else of value to the mining fraternity.

As this Bulletin comprises a Census of State Minerals, it is peculiarly adapted to commence the series and is therefore numbered "Bulletin 1."

A. H. PANTON,  
Minister for Mines.

# Census of Western Australian Minerals.

By DOROTHY CARROLL, Ph.D., D.I.C.

---

The following list of Western Australian minerals and the localities in which they occur has been compiled from records kept in the Government Chemical Laboratory, which undertakes the mineralogical work for this State, and from published work of the Geological Survey and the Geology Department of the University of Western Australia. The list may be considered to be fairly complete to the end of 1943. A previous census compiled by the late Dr. E. S. Simpson appeared in 1912 in the "Guide to the Western Australian Museum, Part VI, The Mineral Collections."

In this census the minerals are listed alphabetically, and the places at which each has been recorded are localised in the following areas into which the State has been divided as shown on the accompanying map (see frontispiece):—Kimberley, North East, North West, Murchison, South West, Central, Eucla, South East. Most of the localities will be found on the 1942 50-mile map of Western Australia issued by the Surveyor General.

Detailed lists of localities are not given for the common rock-forming minerals such as quartz, felspar, micas, amphiboles, etc., except where their occurrence is of economic or scientific interest. If a mineral is not listed at a certain locality, this does not necessarily mean that it does not occur there. This is true of the rock-forming minerals and such minerals as limonite and the clay minerals.

It is proposed to make supplementary lists of mineral records from time to time.
